HEALTHCARE AND PUBLIC HEALTH SECTOR-SPECIFIC CYBERSECURITY PERFORMANCE GOALS

STRENGTHENING THE CYBERSECURITY OF THE HEALTHCARE SECTOR AND KEEPING PATIENTS SAFE AND SECURE
HEALTHCARE AND PUBLIC HEALTH SECTOR-SPECIFIC
CYBERSECURITY PERFORMANCE GOALS

STRENGTHENING THE CYBERSECURITY OF THE HEALTHCARE SECTOR AND KEEPING PATIENTS SAFE AND SECURE

The Department of Health and Human Services (HHS) helps the Healthcare and Public Health (HPH) critical infrastructure sector prepare for and respond to cyber threats, adapt to the evolving threat landscape, and build a more resilient sector. As outlined in the HHS Healthcare Sector Cybersecurity concept paper, HHS is publishing these voluntary healthcare specific Cybersecurity Performance Goals (CPGs) to help healthcare organizations prioritize implementation of high-impact cybersecurity practices. The HPH CPGs are designed to better protect the healthcare sector from cyberattacks, improve response when events occur, and minimize residual risk. HPH CPGs include both essential goals to outline minimum foundational practices for cybersecurity performance and enhanced goals to encourage adoption of more advanced practices.
Linking Cybersecurity and the HPH CPGs

In March 2023, the Department of Homeland Security’s Cybersecurity and Infrastructure Security Agency (CISA) released its Cross-Sector CPGs which serve as a national, critical-infrastructure cybersecurity baseline. HHS, in collaboration with CISA and industry, have adapted CISA’s CPGs to develop voluntary HPH CPGs.

These goals are a voluntary subset of cybersecurity practices that healthcare organizations, and healthcare delivery organizations in particular, can prioritize to strengthen cyber preparedness, improve cyber resiliency, and ultimately protect patient health information and safety. They were built off the chassis of CISA’s CPGs and informed by common industry cybersecurity frameworks, guidelines, best practices, and strategies (e.g., Healthcare Industry Cybersecurity Practices, National Institute of Standards and Technology (NIST) Cybersecurity Framework, and the National Cybersecurity Strategy). The HPH CPGs directly address common attack vectors against U.S. domestic hospitals as identified in the 2023 Hospital Cyber Resiliency Landscape Analysis.

These resiliency-based goals complement HHS’ ongoing work to improve cybersecurity in medical devices through the Food and Drug Administration’s establishment of pre-market cybersecurity requirements and recommendations for medical devices, and promote cybersecurity through the Office for Civil Rights’ continuous administration and enforcement of the Health Insurance Portability and Accountability Act Privacy, Security, and Breach notification rules.

Navigating the HPH CPGs

The HPH CPGs are designed to ensure layered protection at different stages of the attack chain, or points in digital systems that can be exploited, which is crucial to mitigating the impacts of cybersecurity incidents if and when they occur. They are divided into two categories of goals:

- **Essential Goals** to help healthcare organizations address common vulnerabilities by setting a floor of safeguards that will better protect them from cyberattacks, improve response when events occur, and minimize residual risk.

- **Enhanced Goals** to help healthcare organizations mature their cybersecurity capabilities and reach the next level of defense needed to protect against additional attack vectors.
ESSENTIAL GOALS

to help healthcare organizations address common vulnerabilities by setting a floor of safeguards that will better protect them from cyberattacks, improve response when events occur, and minimize residual risk.

Mapping HPH CPGs to Health Industry Cybersecurity Practices to Facilitate Implementation

---

**Essential Goals**

The Essential Goals* are as follows:

- **Mitigate Known Vulnerabilities**: Reduce the likelihood of threat actors exploiting known vulnerabilities to breach organizational networks that are directly accessible from the Internet.

- **Email Security**: Reduce risk from common email-based threats, such as email spoofing, phishing, and fraud.

- **Multifactor Authentication**: Add a critical, additional layer of security, where safe and technically capable, to protect assets and accounts directly accessible from the Internet.

- **Basic Cybersecurity Training**: Ensure organizational users learn and perform more secure behaviors.

- **Strong Encryption**: Deploy encryption to maintain confidentiality of sensitive data and integrity of Information Technology (IT) and Operational Technology (OT) traffic in motion.

- **Revoke Credentials for Departing Workforce Members, Including Employees, Contractors, Affiliates, and Volunteers**: Prevent unauthorized access to organizational accounts or resources by former workforce members, including employees, contractors, affiliates, and volunteers by removing access promptly.

- **Basic Incident Planning and Preparedness**: Ensure safe and effective organizational responses to, restoration of, and recovery from significant cybersecurity incidents.

- **Unique Credentials**: Use unique credentials inside organizations’ networks to detect anomalous activity and prevent attackers from moving laterally across the organization, particularly between IT and OT networks.

- **Separate User and Privileged Accounts**: Establish secondary accounts to prevent threat actors from accessing privileged or administrative accounts when common user accounts are compromised.

- **Vendor/Supplier Cybersecurity Requirements**: Identify, assess, and mitigate risks associated with third party products and services.

*See appendix 1 for more details on the essential CPGs.
Enhanced Goals

The Enhanced Goals** are as follows:

- **Asset Inventory**: Identify known, unknown (shadow), and unmanaged assets to more rapidly detect and respond to potential risks and vulnerabilities.

- **Third Party Vulnerability Disclosure**: Establish processes to promptly discover and respond to known threats and vulnerabilities in assets provided by vendors and service providers.

- **Third Party Incident Reporting**: Establish processes to promptly discover and respond to known security incidents or breaches across vendors and service providers.

- **Cybersecurity Testing**: Establish processes to promptly discover and responsibly share vulnerabilities in assets discovered through penetration testing and attack simulations.

- **Cybersecurity Mitigation**: Establish processes internally to act quickly on prioritized vulnerabilities discovered through penetration testing and attack simulations.

- **Detect and Respond to Relevant Threats and Tactics, Techniques, and Procedures (TTP)**: Ensure organizational awareness of and ability to detect relevant threats and TTPs at endpoints. Ensure organizations are able to secure entry and exit points to its network with endpoint protection.

- **Network Segmentation**: Mission critical assets are separated into discrete network segments to minimize lateral movement by threat actors after initial compromise.

- **Centralized Log Collection**: Collection of necessary telemetry from security log data sources within an organization’s network that maximizes visibility, cost effectiveness, and faster response to incidents.

- **Centralized Incident Planning and Preparedness**: Ensure organizations consistently maintain, drill, and update cybersecurity incident response plans for relevant threat scenarios.

- **Configuration Management**: Define secure device and system settings in a consistent manner and maintain them according to established baselines.

**See appendix 2 for more details on the enhanced CPGs.

DEPLOYING THE HPH CPGS

Below is a mapping of the HPH CPGs using the *Cyber Defense Matrix* that underscores how the goals can help provide protection across an organization’s IT enterprise and the cyber threat landscape. The HPH CPGs directly address common attack methods threat actors use today to attack the healthcare sector. The defense matrix organizes protections across the assets that make up an IT infrastructure in relation to which functions those protections fall within NIST’s Cybersecurity Framework.

Taken together, the HPH CPGs offer a sound foundation for cyber preparedness and resiliency for healthcare organizations.
